

## **Concept: Views**

**Aim:** To create various views of a table.

### **Theory:**

#### **Syntax:**

Create view <viewname> as (select query);

Desc <viewname>;

Select \* from <viewname>;

### **Exercise:**

1. Create various views of a table.
2. Display records from view.
3. Update a record in a view and commit.
4. Display the record of view and parent table and see whether the updations are reflected in parent table or not.
5. Similarly update a record in parent table and see if it is changed in view also or not.
6. Insert a record in view and check in parent table.

### **Observe whether**

1. Changes made in view are also reflected in parent table.
2. Changes made in parent table are also reflected in view.
3. Views are virtual tables. So all those operations on table are applicable on view.
